ONF Sexual Health Education Project

Demographics
- 13 participants in the group education sessions
- 7 females and 6 males
- 4 married participants and 9 single participants
- Average age 51.7 years (age range 26-73 years)

Evaluation of Education Sessions
- Completed following the session by questionnaire

Feedback
- One patient strongly disagreed about the timing of the education, saying he wished it had been provided during the recovery period of his ABI. He was a member of the ABI support group and had been living with his injury for a long time.
- In the same vein, another participant was glad the information had been provided to her prior to her discharge from the inpatient ABI program.
- Another patient was impressed with the comfort of the presenter, saying they seemed very comfortable providing the information and provided good answers to their questions.
- Another commented that sexuality is a, “great topic to discuss with ABI patients, sexual health is something I had considered as part of my rehab process and it's important to be aware of some of the changes/challenges that may come up.”
